Application for Site Reliability Engineering opportunities

Dear Hiring Team,

I am applying for Site Reliability Engineering opportunities where I can contribute hands-on Linux administration, cloud infrastructure automation, and production support experience. My work spans server operations, software delivery, security, and engineering team leadership, with a focus on dependable services and practical problem resolution.

As a Solutions Architect at Belle Fleur Technologies from March 2021 to July 2023, I owned AWS server provisioning, application deployment, monitoring, and ongoing support. I used Terraform and AWS CloudFormation to provision infrastructure, Ansible and Chef to manage configuration, and Jenkins, Git, and GitHub to support delivery workflows. I also supported Docker and Kubernetes workloads and investigated operational issues with Grafana, Nagios, and ELK.

At the University of Maryland Extension from July 2023 to August 2026, I progressed from Digital Navigator to IT Program Manager and led a small engineering team delivering internal applications and automations. I built a multilingual AI call center designed for 24/7 assistance using Python, Google Cloud, Vertex AI, and Twilio, with document ingestion and retrieval-augmented generation to ground responses in departmental content.

My earlier Linux System Administrator role at Modus Technology Services, from February 2017 to May 2020, established my foundation in access controls, storage, backups, monitoring, and troubleshooting. I would welcome the opportunity to bring this operational background, clear communication, and automation experience to your team. I am available for on-call rotation.

Thank you for your consideration.

Sincerely,

Getachew Ferede
